Wildflowers bloom along the East Fork Mill Creek in Twin Creek Preserve, June 2014

This once-vacant industrial parcel has been transformed into a 30-acre urban oasis that provides environmental and economic benefits. Restoration includes 4,300 feet of stream channel and 5-acres of wetland to provide native habitat for flora and fauna, improve water quality, and reduce flooding. Stroll the 0.5-mile loop trail and enjoy birds, fish, butterflies, and wildflowers.

## What is Twin Creek Preserve?

This wetland construction and stream restoration project is located in the upper portion of the Mill Creek Watershed in Sharonville, Ohio, where the East Fork Mill Creek flows into the main stem Mill Creek. The new stream-side park is a true example of what can be accomplished with the cooperation of public and private partners, \$2.1 million in state and federal grant funding, and a little persistence. Twin Creek Preserve provides critical stream and wetland habitat necessary for a broad array of aquatic organisms, and is home to thousands of native plants.

## PROJECT GOALS

Improved water quality

Improved terrestrial and aquatic habitat

Reduced flooding

Recreational and educational opportunities
